**Summer Internship Task: Google Meet AI Scribe**

**Overview**

**The Challenge:** Build a functional, hosted web application that can deploy a bot to join a Google Meet, "listen" to the conversation, and generate a concise summary of the discussion.

While we want to see the basic functionality working first, we encourage you to go as far as possible with design and additional features. Selection will be based on the effort, thought process, and how effectively you utilize **Generative AI** throughout the development and within the app itself.

**Deadline:** April 15th, 2026

---

**Technical Requirements**

1. **Framework:** You are free to use any frontend framework of your choice (e.g., React, Vue, Next.js, or standard HTML/CSS/JS).
2. **AI Integration:** We highly encourage the use of GenAI. You can use tools like Google's **Gemini 3**, OpenAI's GPT-4, or coding agents like **Cline** to help you build the application or power the summarization logic.
3. **API:** You may use the Gemini API (or a similar LLM API) to process the transcript/audio and generate the summary.
4. **Web Hosting:** Your application must be live and publicly accessible. We recommend using **Firebase** or **Netlify** (both offer free tiers).
5. **Cloud Infrastructure:** Please set up a free **AWS** or **GCP** account (which typically provides $300 in credits) to handle any backend or storage needs.

---

**Core Objectives**

- **Meet Integration:** The bot must successfully join a Google Meet via a provided link.
- **Audio/Transcript Processing:** The bot needs to capture the conversation (listening/transcribing).
- **AI Summarization:** Successfully integrate an AI service to process the conversation into a coherent summary.
- **Responsive UI:** A clean, user-friendly interface to manage the bot and view saved summaries.

**Bonus Points**

- **Authentication:** Implement a User Login and Signup system.
- **Cloud Storage:** Store the generated summaries or conversation logs in an **AWS S3** bucket or **GCP Cloud Storage**.
- **Advanced UI/UX:** High-quality design, animations, or real-time status updates for the bot.

---

**Submission Instructions**

Please submit your entry via the Google Form provided below. Your submission must include:

1. A **Live URL** of the hosted application.
2. A brief explanation of how you used GenAI to assist in your development process.
